

SYSTEM AND METHOD FOR DETERMINING LIKELY IDENTITY IN A BIOMETRIC DATABASE

ABSTRACT OF THE DISCLOSURE

5

A system and method for finding one or more target biometric samples that are similar to or match a query biometric sample. A query feature vector is generated from a query biometric vector. The query biometric vector represents the query biometric sample as a set of characteristics. The characteristics are either invariable or variable. The query feature vector comprises a plurality of features which are derived from the query biometric vector using a process that includes canonicalization of the characters in the biometric vector. The query feature vector is compared to a plurality of similarly created target feature vectors, each target feature vector representing a respective target biometric sample. A target biometric sample is a potential match to the query biometric sample when a threshold number of features in the corresponding target feature vector are identical to features in the query biometric vector.

One good note, our green gear didn't turn
out as well as I had hoped, though most of the cost
was in the materials.
